

TRUSTED DATA BY COMBINING DATA WAREHOUSE AUTOMATION & DATA TEST AUTOMATION

V 1.1

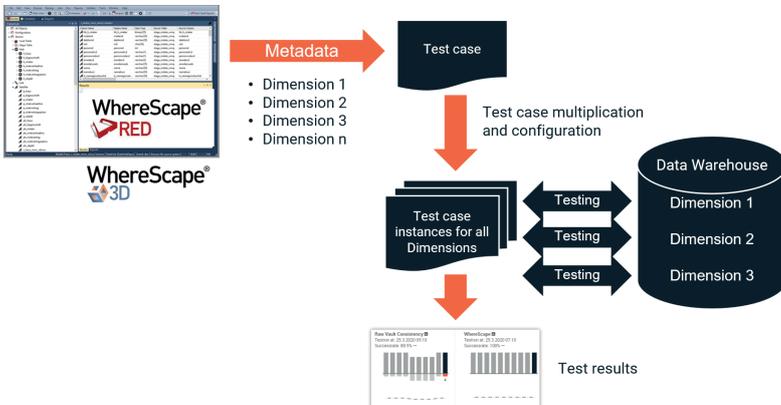

End to end automation in a data warehouse project allows you to deliver a trustful data base on time and in budget. The standardization that comes with automation, together with reliable testing processes, ensures a high quality with a huge business value.

Data warehouse automation with **WhereScape 3D and RED** leads to this result and **BiG EVAL Data Test Automation** fills the gap in the agile process cycle and extends the degree of automation in your project. It makes you capable of executing best practices regression tests as many as you want by the push of a button (or even scheduled or embedded into your CI/CD processes).

TESTING BASED ON WHERESCAPES METADATA

Instead of implementing a test case for every single entity over and over again, inject WhereScapes meta data and apply the test case to all current and future entities automatically. This saves a lot of time and maximizes the test coverage.

YOUR BENEFITS

- **No compromise or investment in additional testing resources** when the amount of test cases grows over time.
- **A standard software solution in Swiss quality** to automate and scale your data warehouse and BI test processes
- **Alerting- and decision-processes** when errors arise with comprehensive analysis
- **More time** for implementing new user stories instead of manually testing
- **Quality Gates** allow to continuously deploy your system depending on the testing results
- **Control** and a central overview

OUR SATISFIED CUSTOMERS

"We compared various other test tools and except for BiG EVAL, none of them was capable of fetching meta data from WhereScape and using it in the test case definitions what makes it so powerful."
